ARINC AviNet® Airport

**IP-based network for airline and airport operations**

Airport operations rely on complex architectures of systems and applications. We know having those pieces all work together efficiently and cost-effectively is at the very core of successful airline and airport operations. Rockwell Collins’ ARINC AviNet® Airport, enables legacy and IP applications, whether they are used by passenger processing or back-office systems, to share the same physical connection, bridging airline host systems and airport services. Each customer connection is installed, proactively managed, maintained and supported.

ARINC AviNet Airport — using standard network hardware technologies requiring no custom development — meets all network requirements for connecting airline departure control systems to airport-based passenger processing systems, including dedicated and common-use terminal equipment and self-service check-in systems. The single connection supports both common-use and back-office settings, regardless of protocol requirements, thus eliminating the cost associated with multiple, dedicated connections.

Key features and benefits include:

- Employs the most cost-effective IP access technology in any location
- No usage-based charges for IP or legacy protocols
- Rapid implementation for airline customers within 10 days
- 24/7 proactive management
- Problem resolution, including break-fix maintenance at each site, is backed by SLAs
- Single point-of-contact and ownership ensures high levels of customer and user satisfaction and prevents disputes over responsibility
- Supports all airport data communication requirements
- Easily customizable for customer applications in shared or dedicated systems environments

**Quick facts**

- Single IP connection for common-use and back-office systems
- Utilizes standard network hardware technologies
- Eliminates costs of multiple, dedicated connections
- Mitigate risks associated with multiple users from different companies operating in a common-use environment
- Proactive monitoring of service providers to ensure consistent performance levels and continual cost optimization
About Rockwell Collins

Rockwell Collins is a pioneer in the development and deployment of innovative communication and aviation electronic solutions for commercial and government applications. Our ARINC information management services offer seamless, secure and reliable solutions to customers in the aviation & airport, rail and critical infrastructure sectors and enable mission-critical data and voice communications and management throughout the world.
